

# Sockets for SD Memory Cards

Applicable for UHS-II

### Features

- > With the both-side metal shell structure, Improves noise reduction, connector robustness, and reduces heat radiation.
- > Since its structure is not easily affected by reflow heat, it maintains SMD contact coplanarity after reflow.
- > SMD-type and Through Hole type shell structures are in production.
- > Compatible with the SDIO standard.
- > Optimal SD Card socket for the next-generation SD memory card standard, "UHS-II."

- ④ Card pop-out prevention function 6: Provided
- ⑤ Shell structure 2: SMD 1: Through Hole
- ⑥ Packing condition P: Emboss 450 pc/ reel x 2 reels per carton included

### ● Both-side metal shell structure with superior "EMI resistance," "robustness," and "SMD contact Coplanarity."

Noise generation accompanied by high speed data transmission has been reduced by 20% when compared to our conventional one-side metal shell products (hereinafter called, "conventional product").

Binding between top and bottom shells is very strong; more than six times the robustness of conventional products has been achieved.

It releases heat generated by high speed and high density operations and prevents performance deterioration (internal temperature of the card: 8°C cooler than conventional products).

## ◎Specification

ITEM		CHARACTERISTIC	TEST CONDITION
Electric Characteristics	Current Rating	0.5A/Pin	—
	Contact Resistance	Signal contact: 100mΩ MAX. (initial) Detection contact: 150mΩ MAX. (initial)	Measure in JIS C5402 measurement method. (Open circuit voltage: 20mV MAX. Closed circuit current: 10mV MAX.)
	Insulation Resistance	Over 1,000MΩ (Initial)	Measure with a D.C. 500V megger for a minute.
	Breakdown Voltage	At A.C. 500V for a minute.	Apply the standard voltage for a minute, and there must be no short circuit and damage at detection current 1mA.
Mechanical Characteristics	Vibration Resistance	There must be no contact opening more than 0.1μs. (Signal contact)	Frequency 10Hz ~ 2,000Hz Acceleration: 20.0m/S <sup>2</sup>
	Insertion Force	Less than 40N	—
	Removal Force	1N or more, less than 40N	—
Insertion and Removal Life	Card Insertion and Removal Life	Mechanical life: 5,000 times (UHS-II Card) 3,000 times (non UHS-II Card) Contact resistance after the test: Signal contact: 40mΩ MAX. change Detection contact: 150mΩ MAX. Insulation resistance after the test: 100MΩ MIN.	Repetitive insertion and removal frequency is below 600 times / hour.
Environmental Characteristics	Ambient Temperature	-25°C to +90°C	There must be no freezing and condensation in low temperature.
	Storage Temperature	-40°C to +90°C the warranty temperature in our company's packaging mode is -40°C to +50°C.	There must be no freezing and condensation in low temperature.
	Resistant to Soldering Heat	Reflow soldering Maximum temperature is below +250°C. Manual soldering Soldering tip temperature is below +300°C and 5 seconds.	It is conducted the soldering with an infrared reflow soldering equipment. The surface temperature of a printed circuit board.
	Resistant to Humidity (In mated state)	Contact resistance after the test Signal contact: 40mΩ MAX. change Detection contact: 150mΩ MAX. Insulation resistance after the test: 100MΩ MIN.	MIL-STD-1344A, METHOD1002 Temperature +40°C Humidity 90%Rh ~ 95% Rh Time of test 500 hours
Applicable Memory Card		SD memory card <sup>※1</sup>	—

● **Both-side metal shell structure with superior "EMI resistance," "robustness," and "terminal flatness."**

Robustness and shielding performance are secured by the structure using welding for binding upper and lower metal shells. Providing a ground pattern when mounting the socket is effective for EMI protection.

Since its structure is not easily affected by reflow heat, it maintains SMD Contact terminal coplanarity after reflow.

P.C.B. mounting dimensional drawing (Connector attachment surface drawing)

Metal mask recommended machining drawing  
Metal mask thickness: 120µm

## Designing P.C.B.

Apply the recommended foot print pattern for designing the P.C.B. in order to secure the mechanical strength at the soldering section of terminals.

## When implementing the socket

- 1) During the reflow soldering, if the slider (sliding section) is locked, the slider deforms by the heat, and operation of the slider becomes not possible. If the card is ejected and inserted before the soldering process, ensure that the slider lock is released before the implementation.
- 2) Ensure not to apply unintentional external force to the contacting section or terminal during an implementation to the P/C board. Otherwise, deformation may occur.
- 3) When automatic implementation is selected by using tray packaging, check the actual tray to be used for considering about implementation.

## Soldering

- 1) Reflow soldering
  - When printing the creme soldering, screen printing method is recommended.
  - When printing the creme soldering, perform with the screen thickness of 0.12 mm with the recommended foot pattern.
  - Set the metal mask aperture rate of 75% for the COM contact (one section) and NO contacts (two sections).
  - When a thickness other than the recommended screen printing thickness is required, please contact us.
  - For the recommended condition, refer to "Reflow temperature profiles" on the following page.
  - Measure and set the temperature on a P.C.B. surface near the contact.
  - When the reflow soldering is conducted on the rear side after the socket reflow is conducted, the socket may fall. Fix the socket with a tape, adhesive, etc. Double reflow soldering is available.
- 2) Manual soldering
  - Perform soldering by applying the soldering iron for five seconds or shorter with the soldering iron tip at +300°C.
  - When without stand off type is used, long duration of soldering and/or too much solder paste may lead creep-up of solder paste. Please be careful.

## Washing after soldering

This product has a sliding section, card detecting contact, and a section corresponding a write protection. If the product is washed, residue such as flux may be left inside after washing, which disable card insertion/ejection or contact failure of the contact. Thus, please do not wash the product after soldering. (Partial washing of the P.C.B. and soldering terminal is possible.)

## After implementation of P.C.B.

- 1) Control so the warpage of the P.C.B. is 0.03 mm or lower to the entire board length.
- 2) When storing the P.C.B. assemblies and blocks in progress, pay close attention not to apply excessive load on piled-up sockets.
- 3) When transferring the P.C.B. assemblies and blocks in progress, pay close attention not to apply external force on the sockets.

## Handling of each product

- 1) Handle with care not to drop to a floor from a work desk, etc.

- 2) When an excessive force is applied to the terminal, the terminal may be deformed, and the terminal flatness will be lost. Pay close attention.
- 3) Repetitive bending of the terminal leads bending fault.

## Matching of cards

- 1) The molded section of this product is partially thin with the purposes of downsizing and weight saving. Take sufficient consideration on the housing design so the forcible insertion/ejection can be avoided.
- 2) The product is adopting the structure preventing reverse insertions of the card. If reverse insertion is tried for many times, the socket and the card may be broken.
- 3) When a card is inserted/ejected at the socket when the soldering process is not completed, weakening of the fixing force at the matching section and a failure in flatness may be lead.
- 4) When a card is forcibly ejected while it is properly inserted, the locking performance against card dropping deteriorates. When ejecting a card, be sure to push in the card toward the card insertion direction to release the lock. Then, eject the card properly.
- 5) The compatible card is an SD memory card. Take appropriate measures such as calling for an attention with the following contents in the instruction manual.
  - When an MMC card is inserted, the No. 7 and 8 signal contacts of the socket may be short-circuited to the contacting section of No. 7 of MMC.
  - When an MMC card is inserted to the socket, the resistance at card insertion/ejection becomes larger due to difference in shapes with the SD cards. If a card is inserted unintentionally, incomplete ejection or damages on the socket and the card may be lead.

## Housing design

- 1) The molded section of this product is partially thin with the purposes of downsizing and weight saving. Take sufficient consideration on the housing design so the forcible insertion/ejection can be avoided.
- 2) To smoothly insert/eject a card, take an appropriate measure for the housing design so excessive force is not applied on the metal shell on the top of the socket. When any force suppressing the metal shell is applied, the card is also suppressed and cannot be ejected.
- 3) In order to avoid a large force applied on the socket body when inserting/ejecting a card, hold the housing by using a guide or so.

## Unexpected pop-out of a card

- 1) The socket has preventive functions against popping out of a card under certain conditions. However, it is strongly recommended to call for an attention of users from a viewpoint of product reliability, so accidents due to incorrect usage can be prevented in advance.
- 2) Due to the socket mechanism, the product lifetime is not warranted after (1) incomplete insertion of a card, (2) reverse insertion of a card, and (3) prevention of popping out of a card after reverse insertion.
- 3) This socket is applied with a resistance at the insertion and ejection of a card in order to prevent popping out of a card. Therefore, be aware that a certain resistance is felt when inserting/ejecting a card in normal circumstances.

## Others

After soldering, when the P.C.B. is coated for prevention of insulation deterioration, take an appropriate measure not to accidentally apply the coating agent to the socket.

## ■Applicable to UHS-II (AXA5■306■P)

## ■Applicable to UHS-I (AXA2■30■P-M)

## Reflow temperature profile (reference value)

The described temperature profile is only for reference. Conditions vary depending on the P.C.B. size or so, and the provided profile may not match. Ensure to evaluate the implementation check in advance.

### ●Precautions on this catalog

Specifications are only for reference. The specifications do not warrant the performance of the product at the customer's site. Due to modifications or other reasons, the contents may be changed without prior notice. Contact our salesperson for details of the products. When reviewing for actual application of the product and designing a P.C.B., please contact our salesperson in advance.
